About Gross Profit Margin

A gross profit margin is the difference between sales and the cost of goods sold divided by revenue. This represents the percentage of each dollar of a company's revenue available after accounting for cost of goods sold.

If a company produces phones and earns \$32 million in sales but pays \$24 million for the items sold, then the company's gross profit margin would be $(\$32M - \$24M) / \$32M = 25$ percent.

Cutting costs result in higher gross profit margins. If a company sells phones for 500 dollars and the cost of the producing the phone is \$250, the current gross profit margin is 50 percent $((500-250)/500)$. If the company is able to reduce production costs from \$250 to \$200, the gross profit margin is 60 percent $((500-200)/500)$.

Note : Profit margins are very dependent on sector. Companies that sell bland potato chips may not have very high margins, but will sell a sizable quantity of potato chips. A company that sells consulting services will likely have higher profit margins, but sell lower quantities.
