Figure 7. The relationship between general practitioner density and the annual number of visits per general practitioner

Notes:
- The following linear regression was fitted to the data:
The annual number of visits per general practitioner $= 6,495 - 2.498 \text{ (number of general practitioners per 1 million population)}$ with $R^2 = 0.56$, p-value of F-test on overall model = 0.001.
